

Connecting to a HPC Windows system via Remote Desktop Software

The following documentation is for people working on Windows.

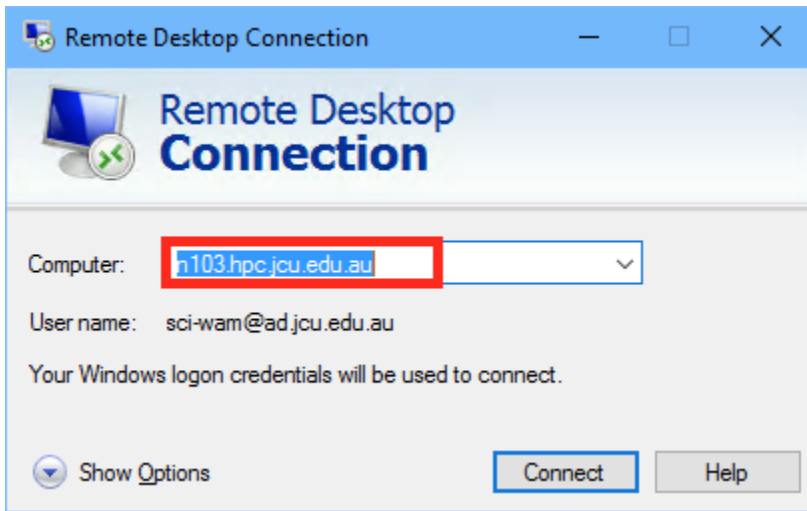

HPC doesn't run many Windows systems and our Microsoft licensing only allows a small number of users to concurrently use a system. On most of our Windows systems, the limit is 2.

Remote Desktop on a HPC Windows System

Click on the start menu and start typing `remote desktop`

Then selection the **Remote Desktop Connection** item.

Click on the **Connect** button and the window you see should be familiar to anyone who has used Windows.

Note: If full screen mode is configured a screen on your desktop will be full consumed. You can turn off full screen mode.
